

Bitset

an array of bool
(Stores Binary of numbers)
Date:

→ `bitset<8> b1(n);`

⇒ `cout << b1;` // output - 0000 0010

⇒ `for (int i=0; i<8; i++) {`
 `cout << b1[i];` // output - 0000 0010
}

1) Initialization

`bitset<32> bset1;` // initializes with all bits 0

`bitset<32> bset2(20);` // initialized with bits of 20

`bitset<32> bset3(string("1100"));` // initialized with binary string
// 00000010 00000000 00000000 00000000

2) array ~~operation~~ indexing operation []

`bset1[6]=1;` // setting the 6th index.

3) count function

`int number of 1 = bset3.count();`

// it returns no. of set bits in bitset.

4) size function

`bset1.size()`; // returns total number of bits in bset1.
~~if~~ `int numbingo = bset1.size() - numbing1;` } ^{is} number of 0 ✓

5) test function

`cout << bset1.test(i);` // return 1 if bit is set
 else return 0.

6) any function / none function

`cout << bset1.any();` // return true if atleast 1 bit.

`cout << bset1.none();` // return true, if none of the bit is set.

7) set() function

① way `bset1.set();` // sets all bits

② way `bset1.set(pos, b);` // makes `bset1[pos] = b`
`if bset1.set(4, 0);`

③ way `bset1.set(pos);` // makes `bset1[pos] = 1`
 i.e default is 1 ✓

8) reset function

↳ same as set() but it makes 0

↑

ex set s. reset(2); // makes set s[2] = 0
set s. reset(); // makes all bits 0.

9) flip function ($0 \Leftrightarrow 1$)

~~ex~~ set s. flip(2); // flips 2nd bit

set s. flip(); // flips all bits.

Note

same as
 $a \oplus b \Rightarrow a = a \oplus b$

$$a \oplus b \Rightarrow a = a \oplus b;$$

$$a \mid b \Rightarrow a = a \mid b;$$

$$a \cap b \Rightarrow a = a \cap b;$$

$$a \gg b \Rightarrow a = a \gg b;$$
